

# Advanced MikroTik Traffic Control

Prague, June, 2011

## Schedule

- 09:00 – 10:30 Morning Session I
  - 10:30 – 11:00 Morning Break
- 11:00 – 12:30 Morning Session II
  - 12:30 – 13:30 Lunch Break
- 13:30 – 15:00 Afternoon Session I
  - 15:00 – 15:30 Afternoon Break
- 15:30 – 17:00 (18.00) Afternoon Session II

Mikrotik Traffic Control 2

## Instructors

- Jaromir Čihák, Sys-DataCom
  - Working as Support and Training Engineer at Mikrotik's SIA (MikroTik), SysDataCom CEO.
  - Specialization: Firewall, QoS, Basic, VPN, Large networks, Wireless.
- Jiří Anděl, i4wifi a.s.
  - Working as Support RouterOS Mikrotik.

Mikrotik Traffic Control 3

## Housekeeping

- Course materials
- Routers, cables
- Break times and lunch
- Restrooms and smoking area locations

Mikrotik Traffic Control 4

VRRP

aa deal Wan

ekurouat face

27.6.2011

### Course Objective

- Provide thorough knowledge and hands-on training for MikroTik RouterOS basic and advanced traffic control capabilities, basic firewalling for networks and multiple networks
- Upon completion of the course you will be able to plan, implement, adjust and debug MikroTik RouterOS network configurations.

Mikrotik Traffic Control 5

### Introduce Yourself

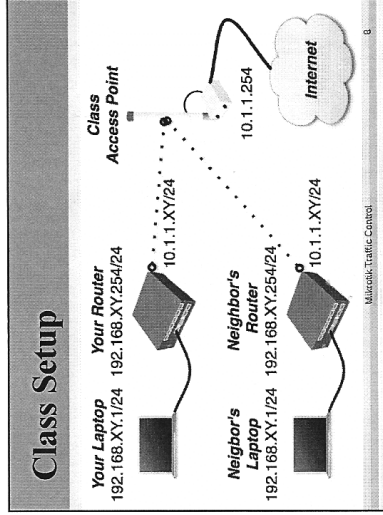

- Please, introduce yourself to the class
  - Your name
  - Your Company
  - Your previous knowledge about RouterOS
  - Your previous knowledge about networking
  - What do you expect from this course?
- Please, remember your class XY number. (X is number of the row, Y is your seat number in the row)
- My number is: \_\_\_\_\_

Mikrotik Traffic Control 6

### Class Setup Lab

- Create an **192.168.XY.0/24** Ethernet network between the laptop (.1) and the router (.254)
- Connect routers to the AP SSID "**AP\_RB433**"
- Assign IP address **10.1.1.XY/24** to the wlan1
- Main **GW** and **DNS** address is **10.1.1.254**
- Gain access to the internet from your laptops via local router
- Create new user for your router and change "**admin**" access rights to "**read**"

Mikrotik Traffic Control 7

### Class setup Lab (cont.)

- Set system identity of the board and wireless radio name to "XY\_<your\_name>". Example: "00\_Ardel"
- Upgrade your router to the latest Mikrotik RouterOS version 4.x
- Upgrade your Winbox loader version
- Set up NTP client – use 10.1.1.254 as server

### Class setup Lab (cont.)

### Class setup Lab (cont.)

- Connect eth2, eth3 LAN cable with your neighbor
- Assign address 172.27.XY.254/24 to eth2
- Assign address 172.27.XY.YOUR\_NEIGHBOR.1/24 to eth3
- Create a configuration backup and copy it to the laptop (it will be default configuration)

### Class setup Lab (cont.)

Interface	Ethernet	ESP Tunnel	IP Tunnel	VLAN	VRRP	Bonding
Name	Type	MTU	Type	MTU	Type	Type
R-eth1-LAN	Ethernet	1532	Ethernet	1532	71.2 kbps	4.8 kbps
R-eth2-DMZ	Ethernet	1532	Ethernet	1532	0 bps	0 bps
R-eth3-DMZ	Ethernet	1532	Ethernet	1532	0 bps	0 bps
R-eth4-INT	Virtual (Mikrotik ARP413)	2208	Virtual (Mikrotik ARP413)	2208	91.6 kbps	3.8 kbps
R-eth5-INT	Virtual (Mikrotik ARP413)	2208	Virtual (Mikrotik ARP413)	2208	0 bps	0 bps

Address List	Name	Address	Broadcast	Interface
+	eth1-LAN	10.1.1.1/24	10.1.1.0	eth1-LAN
+	eth2-DMZ	172.27.1.0/24	172.27.1.255	eth2-DMZ
+	eth3-DMZ	172.27.1.254/24	172.27.1.255	eth3-DMZ
+	eth4-INT	172.27.131/24	172.27.131.255	eth4-INT
+	eth5-INT	192.168.1.254/24	192.168.1.255	eth5-INT

### DNS Client and Cache

Mikrotik Traffic Control 13

### DNS Client and Cache

- DNS client is used only by router in case of web-proxy or hotspot configuration
- Enable **“Allow Remote Requests”** option to transform DNS client into DNS cache
- DNS cache allows to use your router instead of remote DNS server, as all caches - it minimizes resolution time
- DNS cache also can act as DNS server for local area network address resolution

Mikrotik Traffic Control 14

### Static DNS Entry

- Each Static DNS entry will add or **override** (replace existing) entry in the DNS cache

Mikrotik Traffic Control 15

### DNS Cache Lab

- Configure your router as DNS cache. Use **10.1.1.254** as primary DNS server
- Add static **DNS** entry **“www.XY.com”** to your router's Local IP address **(10.1.1.XY - your number)**
- Add static DNS entry **“www.teacher.com”** to **AP Teacher** router's Public IP address **(10.1.1.254)**
- Change your laptops DNS server address to your routers address
- Try the configuration and monitor cache list

Mikrotik Traffic Control 16

## DHCP

- The Dynamic Host Configuration Protocol is used for dynamic distribution of network setting such as:
  - IP address and netmask
  - Default gateway address
  - DNS and NTP server addresses
  - More than 100 other custom option (supported only by specific DHCP clients)
- DHCP is basically insecure and should only be used in trusted networks

17

Mikrotik Traffic Control

## DHCP Comm. scenario

- **DHCP Discovery**  
`src-mac=<client>, dst-mac=<broadcast>, protocol=udp, src-ip=0.0.0.0:68, dst-ip=255.255.255.255:67`
- **DHCP Offer**  
`src-mac=<DHCP-server>, dst-mac=<broadcast>, protocol=udp, src-ip=<DHCP-server>, dst-ip=255.255.255.255:67`
- **DHCP Request**  
`src-mac=<client>, dst-mac=<broadcast>, protocol=udp, src-ip=0.0.0.0:68, dst-ip=255.255.255.255:67`
- **DHCP Acknowledgement**  
`src-mac=<DHCP-server>, dst-mac=<broadcast>, protocol=udp, src-ip=<DHCP-server>, dst-ip=255.255.255.255:67`

18

Mikrotik Traffic Control

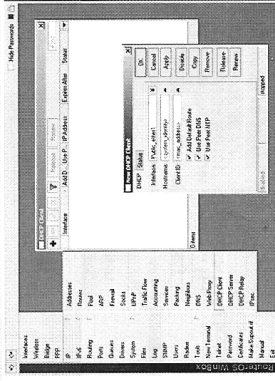

## DHCP Client Identification

- DHCP server are able to track lease association with particular client based on identification
- The identification can be achieved in 2 ways
  - Based on "caller-id" option (*dhcp-client-identifier* from RFC2132)
  - Based on MAC address, if "caller-id" option is not specified
- "hostname" option allow RouterOS clients to send **additional** identification to the server, by default it is "system identity" of the router

19

Mikrotik Traffic Control

## DHCP Client

20

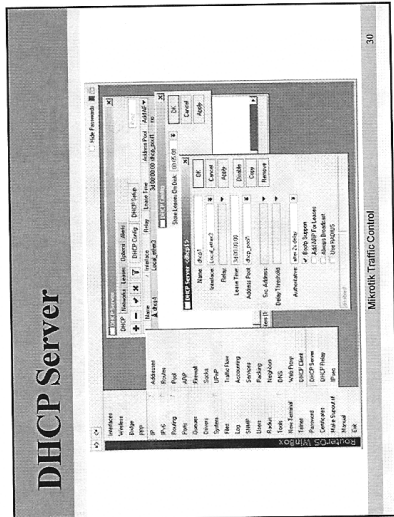

Mikrotik Traffic Control

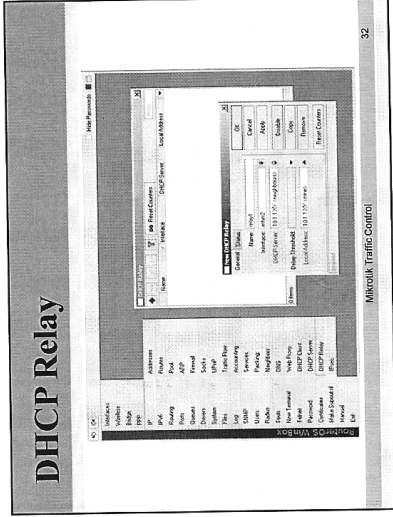

### Authoritative DHCP Server

- Authoritative – allow DHCP server to reply on unknown client's broadcast and ask client to restart the lease (client send broadcasts only if unicast to the server fails when renewing the lease)
- Authoritative allow to:
  - Prevent rouge DHCP server operations
  - Faster network adaptation to DHCP configuration changes

### DHCP Relay

- DHCP Relay is just a proxy that is able to receive a DHCP discovery and request and resend them to the DHCP server
- There can be only one DHCP relay between DHCP server and DHCP client
- DHCP communication with relay does not require IP address on the relay, but relay's "local address" option **must** be the same with server's "relay address" option

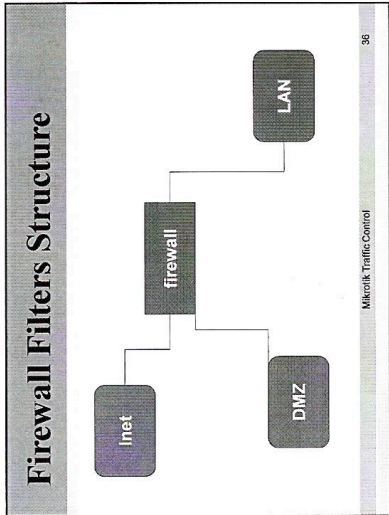

# Firewall

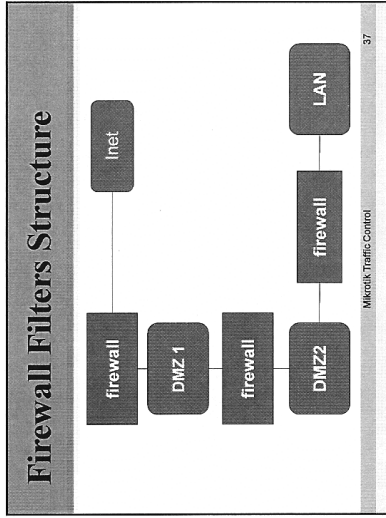

## Firewall Building Tactics

- Drop all unneeded, accept only needed, accept everything else, drop everything else

Input
1
2
3
4
5
6
7
8
9
10
11

Mikrotik Traffic Control 34

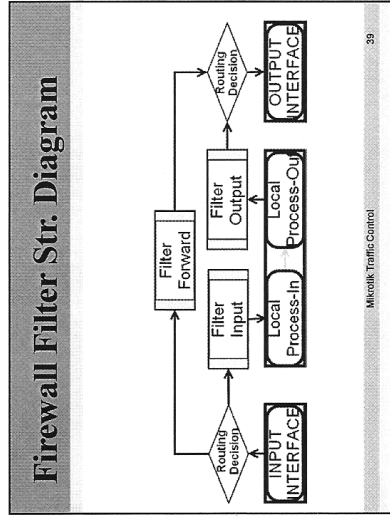

### Firewall Filters Structure

- Firewall filter rules are organized in chains
- There are default and user-defined chains
- There are three default chains
  - **input** – processes packets sent to the router
  - **output** – processes packets sent by the router
  - **forward** – processes packets sent through the router
- Every user-defined chain should subordinate to at least one of the default chains

Mikrotik Traffic Control 38

### Connection Tracking

- Connection Tracking (or Conntrack) system is the heart of firewall, it gathers and manages information about **all** active connections.
- By disabling the conntrack system you will lose functionality of the **NAT** and most of the filter and mangle conditions.
- Each conntrack table entry represents bidirectional data exchange
- Conntrack takes a lot of **CPU** resources (disable it, if you don't use firewall)

Mikrotik Traffic Control 40

## Chain Forward

**Protection of the customers from the viruses and protection of the Internet from the customers**

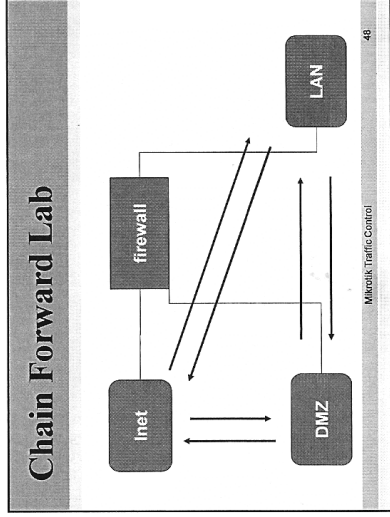

*bravo kienby*

Mikrotik Traffic Control

## Firewall Filter Chains

- The firewall filter facility is a tool for packet filtering
- Firewall filters consist from the sequence of IF-THEN rules
  - 0) IF <condition(s)> THEN <action>
  - 1) IF <condition(s)> THEN <action>
  - 2) IF <condition(s)> THEN <action>
- If a packet doesn't meet all the conditions of the rule, it will be sent on to the next rule.
- If a packet meet all the conditions of the rule, specified action will be performed on it.

Mikrotik Traffic Control

## Chain Forward Lab

- There are followed rules:
  - **Accept** LAN to Internet
  - **Accept** DMZ to Internet
  - **Accept** LAN to DMZ
  - **Drop** Internet to LAN
  - **Drop** DMZ to LAN
  - **Selected** Internet to DMZ

49  
Mikrotik Traffic Control

## Chain Forward Lab

50  
Mikrotik Traffic Control

## Firewall Filter Chains

- You can reroute traffic to user-defined chains using action jump (and reroute it back to the default chain using action return)
- Users can add any number of chains
- User-defined chains are used to optimize the firewall structure and make it more readable and manageable
- User-defined chains help to improve performance by reducing the average number of processed rules per packet

51  
Mikrotik Traffic Control

## User-Defined Chains

52  
Mikrotik Traffic Control

### Address List Options

- Instead of creating one filter rule for each IP network address, you can create only one rule for IP address list.
- Use "Src./Dst. Address List" options
- Create an address list in "ip firewall address-list" menu

### Address List Lab

- Make an address list of most common bogon IPs

### Adv. Address Filtering Lab

- Allow packets to leave your network only from the valid customers addresses
- Allow packets to leave your network only to the valid internet addresses

### Adv. Address Filtering Lab

## Chain Input

**Protection of the router – allowing only necessary services from reliable source with agreeable load.**

*chaiten RB*

## Invalid Rule Example

*ip firewall filter add chain=input connection-state=invalid 1  
Action=drop comment=Drops invalid packets\**

## Connection State Lab

- Create 3 rules to ensure that only connectionstate new packets will proceed through the input filter
  - Drop all connection-state invalid packets
  - Accept all connection-state related packets
  - Accept all connection-state established packets
- Create 3 rules to ensure that only you will be able to connect to the router
  - Accept all packets from your local network
  - Accept all packets as DMZ server
  - Drop everything else

## Connection State Lab

### RouterOS Services Lab

- Create rules to **allow** only necessary RouterOS **services** to be accessed from the public network
- Use action **"log"** to determine those services
- Create rule to allow **winbox**, **ssh** and **telnet** connection from teacher's network (10.1.1.0/24)
- **Arrange** rules accordingly
- Write **comment** for each firewall rule

© Mikrotik, 2007

bloky

### Important Issue

- Firewall filters do not filter **MAC** level communications
- You should turn off **MAC-learn** and **MAC-Winbox** features at least on the public interface
- You should disable network discovery feature and router would not reveal itself anymore
- ("**ip neighbor discovery**" menu)

*tools → mac server*

Mikrotik Traffic Control 69

### Network Intrusion Types

Network intrusion is a serious security risk that could result in not only the temporal denial, but also in total refusal of network service

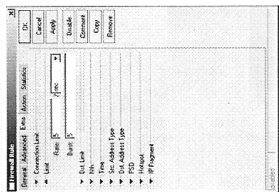

We can point out 4 major network intrusion types:

- Ping flood
- Port scan
- DoS attack
- DDoS attack

Mikrotik Traffic Control 70

### Ping Flood

- Ping flood usually consist from volumes of random ICMP messages
- With "limit" condition it is possible to bound the rule match rate to a given limit
- This condition is often used with action "log"

*Baliscu vidica !!  
obava*

Mikrotik Traffic Control 71

### ICMP Message Types

- Typical IP router uses only five types of ICMP messages (type:code)
  - For PING - messages 0:0 and 8:0
  - For TRACEROUTE – messages 11:0 and 3:3
  - For Path MTU discovery – message 3:4
- Other types of ICMP messages should be blocked

Mikrotik Traffic Control 72

### ICMP Message Rule Examp.

### ICMP Flood Lab

- Make the new chain – ICMP
  - Accept 5 necessary ICMP messages
  - Set match rate to 5 pps with 5 packet burst possibility
  - Drop all other ICMP packets
- Move all ICMP packets to ICMP chain
  - Create an action "jump" rule in the chain Input
  - Place it accordingly
  - Create an action "jump" rule in the chain Forward
  - Place it accordingly

74 Mikrotik Traffic Control

### ICMP Flood Lab

- Make the new chain – ICMP
  - Accept 5 necessary ICMP messages
  - Set match rate to 5 pps with 5 packet burst possibility
  - Drop all other ICMP packets
- Move all ICMP packets to ICMP chain
  - Create an action "jump" rule in the chain Input
  - Place it accordingly
  - Create an action "jump" rule in the chain Forward
  - Place it accordingly

76 Mikrotik Traffic Control

### Port Scan

- Port Scan is sequential TCP (UPD) port probing
- PSD (Port scan detection) is possible only for TCP protocol
- Low ports
  - From 0 to 1023
- High ports
  - From 1024 to 65535

Mikrotik Traffic Control 77

### PSD Lab

- Create PSD protection
  - Create a PSD drop rule in the chain Input
  - Place it accordingly
- Create a PSD drop rule in the chain Forward
  - Place it accordingly

Mikrotik Traffic Control 78

### DoS Attacks

- Main target for DoS attacks is consumption of resources, such as CPU time or bandwidth, so the standard services will get Denial of Service (DoS)
- Usually router is flooded with TCP/SYN (connection request) packets. Causing the server to respond with a TCP/SYN-ACK packet, and waiting for a TCP/ACK packet.
- Mostly DoS attackers are virus infected customers

Mikrotik Traffic Control 79

*vice spoken: 2 IP.*

### DoS Attack Protection

- All IP's with more than 10 connections to the router should be considered as DoS attackers
- With every dropped TCP connection we will allow attacker to create new connection
- We should implement DoS protection into 2 steps:
  - Detection - Creating a list of DoS attackers on the basis of connection-limit
  - Suppression - applying restrictions to the detected DoS attackers

Mikrotik Traffic Control 80

## DoS Attack Detection

81 Mikrotik Traffic Control

## DoS Attack Suppression

- To stop the attacker from creating new connections, we will use action "tarpit"
- We must place this rule before the detection rule or else address-list entry will rewrite all the time

82 Mikrotik Traffic Control

## DDoS attacks

- A Distributed Denial of Service attack is very similar to DoS attack only it occurs from **multiple** compromised systems
- Only thing that could help is "TCP-Syn Cookie" option in conntrack system

83 Mikrotik Traffic Control

## Network Address Translation (NAT)

### Destination NAT, Source NAT, NAT traversal

### NAT Types

- As there are two IP addresses and ports in an IP packet header, there are two types of NAT
  - The one, which rewrites source IP address and/or port is called source NAT (src-nat)
  - The other, which rewrites destination IP address and/or port is called destination NAT (dst-nat)
- Firewall NAT rules process only the first packet of each connection (connection state "new" packets)

85

Mikrotik Traffic Control

### Firewall NAT Structure

- Firewall NAT rules are organized in chains
- There are two default chains
  - **dstnat** – processes traffic sent to and through the router, before it divides in to "input" and "forward" chain of firewall filter.
  - **srcnat** – processes traffic sent from and through the router, after it merges from "output" and "forward" chain of firewall filter.
- There are also user-defined chains

86

Mikrotik Traffic Control

### IP Firewall Diagram

87

Mikrotik Traffic Control

### Dst-nat

- Action "dst-nat" changes packet's destination address and port to specified address and port
- This action can take place only in chain dstnat
- Typical application: ensure access to local network services from public network

88

Mikrotik Traffic Control

*Network only*

### Dst-nat Rule Example

**General** | Advanced | Edit | Action | Help

Name: Example  
 Action: dst-nat  
 In Address: 192.168.0.0/24

Mikrotik Traffic Control 89

### Redirect

- Action "redirect" changes packet's destination address to router's address and specified port
- This action can take place only in chain dstnat
- Typical application: transparent proxying of network services (DNS,HTTP)

Mikrotik Traffic Control 90

### Redirect Rule Example

**General** | Advanced | Edit | Action | Help

Name: Example  
 Action: redirect  
 In Address: 192.168.0.0/24  
 To Port: 53

**Advanced** | Edit | Action | Help

Chain: srcnat  
 Src Address: 192.168.0.0/24  
 Out Address: 192.168.0.0/24  
 Protocol: TCP  
 Src Port: 53  
 Dest Port: 53

In Interface: eth0  
 Out Interface: eth0  
 Post-Action: none  
 Connection-Track: checked  
 Logging-Track: unchecked  
 Connection-Type: none

OK | Cancel | Apply | Disable | Comment | Copy | Remove

Mikrotik Traffic Control 91

### Redirect Lab

- Capture all TCP and UDP port 53 packets originated from your private network 192.168.XY.0/24 and redirect them to the router itself.
- Set your laptops DNS server to the random IP address
- Clear your router's and your browser's DNS cache
- Try browsing the Internet
- Take a look at DNS cache of the router

Mikrotik Traffic Control 92

*Pisowan: portu wa jing*

### Source NAT Drawbacks

- Hosts behind a NAT-enabled router do not have true end-to-end connectivity.
  - connection initiation from outside is not possible
  - some TCP services will work in "passive" mode
  - src-nat behind several IP addresses is unpredictable
  - some protocols will require so-called NAT helpers to work correctly (NAT traversal)

### NAT Helpers

- You can specify ports for existing NAT helpers, but you can not add new helpers

### Web Proxy

- Web-proxy have 3 mayor features
  - HTTP and FTP traffic caching
  - DNS name filtering
  - DNS redirection
- Web-proxy have two operation modes
  - Regular – browser must be configured to use this proxy
  - Transparent – this proxy is not visible for customers
- NAT rules must be applied

## Web-Proxy Caching

- No caching
  - Max-cache-size = none
- Cache to RAM
  - Max-cache-size = none
  - Cache-on-disk = no
- Cache to HDD
  - Max-cache-size = none
  - Cache-on-disk = yes
- Cache drive

Mikrotik Traffic Control 97

## Web-Proxy Options

- **Maximal-client-connections** - number of connections accepted from clients
- **Maximal-server-connections** - number of connections made by server

Mikrotik Traffic Control 98

## Web-Proxy Options

- **Serialize-connections** – use only one connection for proxy and server communication (if server supports persistent HTTP connection)
- **Always-from-cache** - ignore client refresh requests if the cache content is considered fresh
  - **Max-fresh-time** - specifies how long objects without an explicit expiry time will be considered fresh
- **Cache-hit-DSCP** – specify DSCP value for all packets generated from the web-proxy cache

Mikrotik Traffic Control 99

## Web-Proxy Statistics

Mikrotik Traffic Control 100

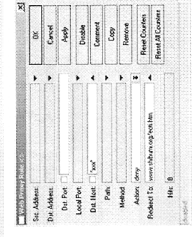

### Proxy Rule Lists

- Web-proxy supports 3 sets of rules for HTTP request filtering
  - **Access List** – dictates policy whether to allow specific HTTP request or not
  - **Direct Access List** – list works only if parent-proxy is specified – dictates policy whether to bypass parent proxy for specific HTTP request or not
  - **Cache List** – dictates policy whether to allow specific HTTP request be cached or not

Mikrotik Traffic Control 101

### Proxy Rules

- It is possible to intercept HTTP request based on:
  - TCP/IP information
  - URL
  - HTTP method
- Access list also allow you to redirect denied request to specific page

Mikrotik Traffic Control 102

### URL Filtering

[http://www.mikrotik.com/docs/ros/2.9/graphics:packet\\_flow31.jpg](http://www.mikrotik.com/docs/ros/2.9/graphics:packet_flow31.jpg)  
Destination host      Destination path

- Special characters
  - `^` - any number of any characters
  - `?` - any character
    - `www.mi?roti?.com`
    - `www.mikrotik*`
    - `* mikrotik*`

Mikrotik Traffic Control 103

### Web-Proxy Lab

- Teacher will have proxy, that redirects all requests to separate web-page on 10.1.1.254
- Enable transparent web-proxy on your router with caching to the memory
- Create rules in access list to check its functionality
- Create rules in direct access list to check its functionality
- Create rules in Cache list to check its functionality

Mikrotik Traffic Control 104

## Firewall Mangle

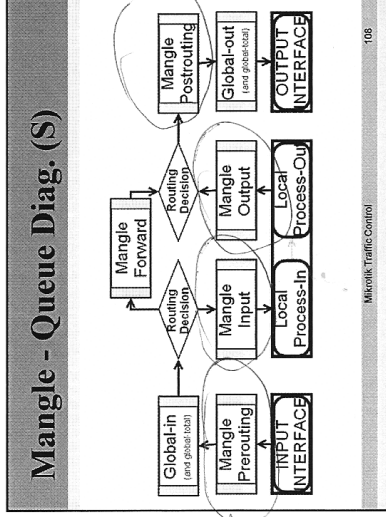

**IP packet marking and IP header fields adjustment**

### What is Mangle?

- The mangle facility allows to mark IP packets with special marks.
- These marks are used by other router facilities like routing and bandwidth management to identify the packets.
- Additionally, the mangle facility is used to modify some fields in the IP header, like TOS (DSCP) and TTL fields.

### Mangle Structure

- Mangle rules are organized in chains
- There are five built-in chains:
  - **Prerouting** - making a mark before Global-In queue
  - **Postrouting** - making a mark before Global-Out queue
  - **Input** - making a mark before Input filter
  - **Output** - making a mark before Output filter
  - **Forward** - making a mark before Forward filter
- New user-defined chains can be added, as necessary

### Mark Packet Rule

General: Chain: mangle, Outgoing Interface: eth1, Action: Mark Connection, New Connection: Precedence, Conn. Mark: 1

Advanced: Mark Connection, New Connection: Precedence, Conn. Mark: 1

### Mangle Packet Mark Lab

- Mark all connections from 192.168.XY.100 address (imaginary VIP 1)
- Mark all packets from VIP 1 connections
- Mark all connections from 192.168.XY.200 address (imaginary VIP 2)
- Mark all packets from VIP 2 connections
- Mark all other connections
- Mark packets from all other connections

### Mangle View

Rule	Action	Chain	Src. Address	Port/Range	New Connection	Dest	Packets
0	mark connection	prevaling	192.168.11.100		Conn_VIP1	0B	0
1	mark connection	prevaling			Conn_VIP2	0B	0
2	mark connection	prevaling	192.168.11.1		Conn_VIP2	1160.2 KB	10.661
3	mark connection	prevaling			all other	22818 KB	11.853
4	mark connection	prevaling			all other	144.3 MB	112703
5	mark connection	prevaling			all other	144.3 MB	112374

### HTB

#### Hierarchical Token Bucket

## HTB

- All Quality of Service implementation in RouterOS is based on Hierarchical Token Bucket
- HTB allows to create hierarchical queue structure and determine relations between parent and child queues and relation between child queues
- RouterOS support 3 virtual HTBs (global-in, global-total, global-out) and one more just before every interface

## Mangle and HTBs

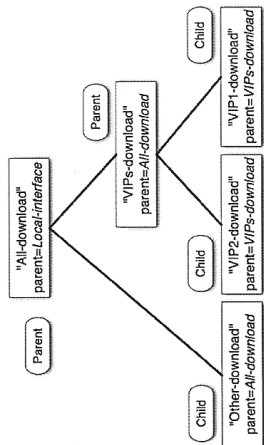

## HTB (cont.)

- When packet travels **through** the router, it passes all 4 HTB trees
- When packet travels **to** the router, it passes only global-in and global-total HTB.
- When packet travels **from** the router, it passes global-out, global-total and interface HTB.

## HTB Features - Structure

- As soon as queue have at least one child it become parent queue
- All child queues (don't matter how many levels of parents they have) are on the same bottom level of HTB
- Child queues make actual traffic consumption, parent queues are responsible only for traffic distribution
- Child queues are not able to get more traffic than parent has

### HTB Features - Structure

### HTB Feat. – Dual Limitation

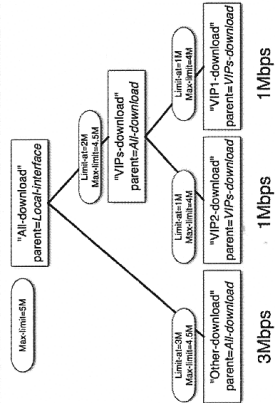

- HTB has two rate limits:
  - CIR (Committed Information Rate)** – in worst case scenario flow will get its **limit-at** no matter what (assuming we can actually send so much data)
  - MIR (Maximal Information Rate)** – in best case scenario a flow can get up to **max-limit** if there is spare bandwidth
- At first HTB will try to satisfy every child queue's CIR (**limit-at**) – only then it will try to reach MIR (**max-limit**)

*m/17*  
*EsauS*

### Dual Limitation

- Maximal rate of the parent must be equal or bigger than sum of committed rates of the children
  - $MIR (parent) \geq CIR(child1) + \dots + CIR(childN)$
- Maximal rate of any child must be less or equal to maximal rate of the parent
  - $MIR (parent) \geq MIR(child1)$
  - $MIR (parent) \geq MIR(child2)$
  - $MIR (parent) \geq MIR(childN)$

### HTB Distribution (limit-at)

## Queue Tree

### Advanced queue structures

## Queue Tree

- Queue tree is direct implementation of HTB
- Each queue in queue tree can be assigned only in one HTB
- Each child queue must have packet mark assigned to it

Name	Parent	Packet Mark	Limit At (bits/s)	Max Len.	Avn. Rate
all-download	global-in	2M	4500k	5M	38.7 kbps
VIP1	all-download	1M		4M	0 bps
VIP2	all-download	1M		4M	17.9 kbps
other	all-download	3M	4500k	3M	21.7 kbps

## Queue Tree and Simple

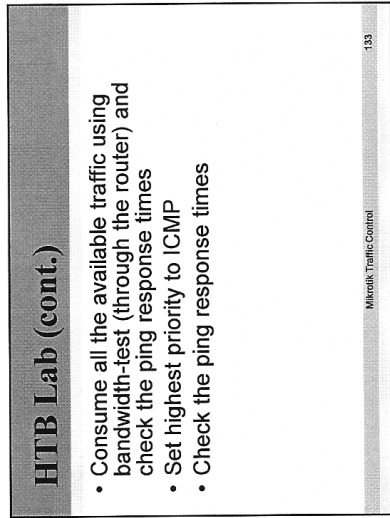

- Tree queue can be placed in 4 different places:
  - Global-in ("direct" part of simple queues are placed here automatically)
  - Global-out ("reverse" part of simple queues are placed here automatically)
  - Global-total ("total" part simple queues are placed here automatically)
  - Interface queue
- If placed in same place Simple queue will take traffic before Queue Tree

## HTB Lab

- Create Queue tree from the example
- Extend mangle and queue tree configuration to prioritize ICMP and HTTP traffic over all other traffic **only** for regular clients
  - Replace regular client packet mark with 3 traffic type specific marks
  - Create 3 child queues for regular client queue in queue tree
  - Assign packet marks to queues

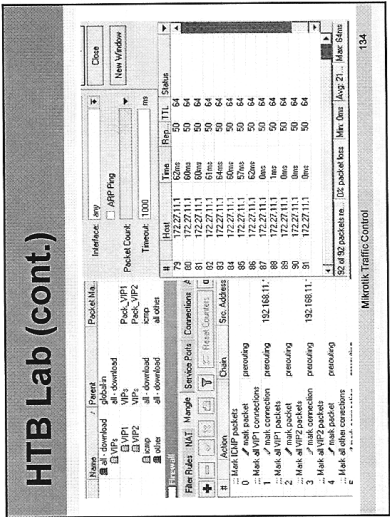

### HTB Lab (cont.)

- Consume all the available traffic using bandwidth-test (through the router) and check the ping response times
- Set highest priority to ICMP
- Check the ping response times

Mikrotik Traffic Control 133

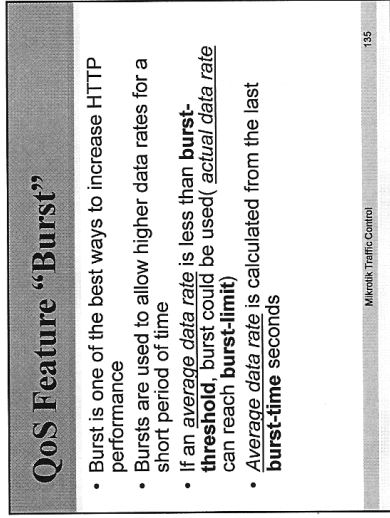

### HTB Lab (cont.)

Mikrotik Traffic Control 134

### QoS Feature "Burst"

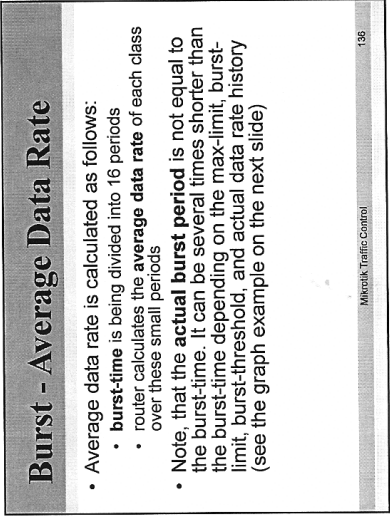

- Burst is one of the best ways to increase HTTP performance
- Bursts are used to allow higher data rates for a short period of time
- If an *average data rate* is less than **burst-threshold**, burst could be used( *actual data rate* can reach **burst-limit**)
- *Average data rate* is calculated from the last **burst-time** seconds

Mikrotik Traffic Control 135

### Burst - Average Data Rate

- Average data rate is calculated as follows:
  - **burst-time** is being divided into 16 periods over these small periods
- Note, that the **actual burst period** is not equal to the burst-time. It can be several times shorter than the burst-time depending on the max-limit, burst-limit, burst-threshold, and actual data rate history (see the graph example on the next slide)

Mikrotik Traffic Control 136

### Limitation with Burst

### Queue Types

- RouterOS have 4 queue types:
  - FIFO – First In First Out (for Bytes or for Packets)
  - RED – Random Early Detect (or Drop)
  - SFQ – Stochastic Fairness Queuing
  - PCQ – Per Connection Queuing (MikroTik Proprietary)
- Each queue type have 2 aspects:
  - Aspect of the Scheduler
  - Aspect of the Shaper

### 100% Shaper

### 100% Scheduler

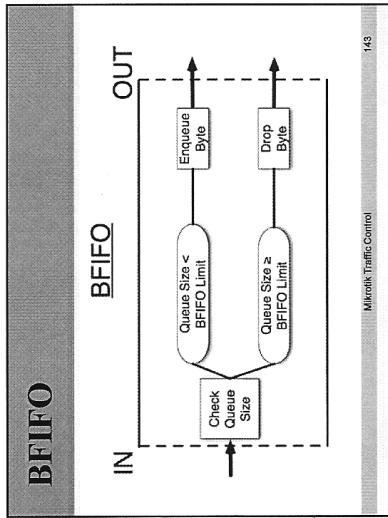

### Default Queue Types

The screenshot shows the Mikrotik Traffic Control interface. The 'New Queue Type' dialog is open, displaying configuration options for a new queue. The 'Type Name' is 'queue1', the 'Kind' is 'fifo', and the 'Queue Size' is '15000 bytes'. There are also buttons for 'OK', 'Cancel', 'Apply', 'Copy', and 'Remove'.

### FIFO

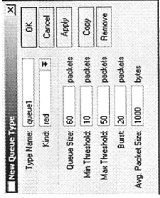

- Behaviour:
  - What comes in first is handled first, what comes in next waits until the first is finished. Number of waiting units (Packets or Bytes) is limited by "queue size" option. If queue "is full" next units are dropped

This slide shows the same 'New Queue Type' dialog box as the previous slide, but with the 'Queue Size' set to '10 packets'. The 'Kind' is still 'fifo'.

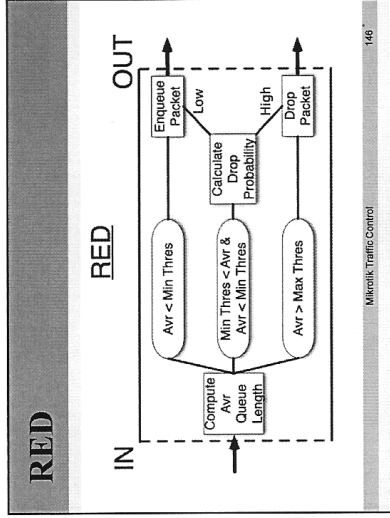

### RED

- Behaviour:
  - Same as FIFO with feature – additional drop probability even if queue is not full.
- This probability is based on comparison of average queue length over some period of time to minimal and maximal threshold – closer to maximal threshold bigger the chance of drop.

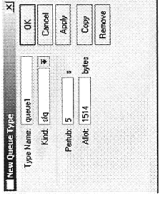

Mikrotik Traffic Control 145

### SFQ

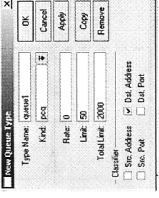

- Behaviour:
  - Based on hash value from source and destination address SFQ divides traffic into 1024 sub-streams
- Then Round Robin algorithm will distribute equal amount of traffic to each sub-stream

Mikrotik Traffic Control 147

### PCQ

- Behaviour:
  - Based on classifier PCQ divides traffic into substreams. Each sub-stream can be considered as FIFO queue with queue size specified by "limit" option
  - After this PCQ can be considered as FIFO queue where queue size is specified by "total-limit" option.

Mikrotik Traffic Control 148

### SFQ Example

- SFQ should be used for equalizing similar connection
- Usually used to manage information flow to or from the servers, so it can offer services to every customer
- Ideal for p2p limitation, it is possible to place strict limitation without dropping connections,

Mikrotik Traffic Control

Microtik Traffic Control 153

### Queue Type Lab

- Try all queue types on "Other-download" queue in your queue tree. Use band-width test to check it.
- Adjust your QoS structure with proper queue type
  - Create a packet mark for all p2p traffic and create SFO queue for it
  - Change HTTP queue type to PCQ

Microtik Traffic Control 154
